

GeoScan Attendance Pro – UX/UI Design Description

Overview

GeoScan Attendance Pro is a web-based application designed to simplify student attendance using QR code technology. The system follows a mobile-first approach, ensuring accessibility on both desktop and mobile devices. It focuses on usability, security, and efficiency in managing class attendance.

Login Page

The login page allows users to enter their Email or Student ID and Password. After authentication:

- Students are redirected to the Student Dashboard
- Lecturers are redirected to the Lecturer Dashboard

For security purposes, login access can be restricted based on location, ensuring that users are within an approved area.

Lecturer Dashboard

The Lecturer Dashboard allows lecturers to manage attendance efficiently. It includes:

- A button to generate a QR code for each class session
- A QR code display area for students to scan
- An attendance section showing students in individual cards with their name, time, and attendance status

The interface is designed for quick interaction and real-time monitoring of attendance.

Student Dashboard

The Student Dashboard enables students to record and track their attendance. It includes:

- A section displaying the current class (Software Engineering)
- A "Scan QR Code" button to mark attendance
- A confirmation message after successful scanning
- An attendance history section showing previous attendance records

Location-Based Attendance Control (Security Feature)

To prevent cheating and false attendance claims, the system integrates **GPS-based location tracking**.

- Students are only allowed to log in and scan the QR code if they are within a specific radius of the classroom.
- The system verifies the user's location in real time before allowing attendance to be recorded.
- If a student is outside the allowed radius, access to scanning or login is restricted.

This feature ensures that only students physically present in class can mark attendance.

Design Principles

- Responsive web design (mobile-first approach)
- Clean and user-friendly interface
- Consistent color scheme (blue, white, light gray)
- Clear layout with proper spacing and alignment
- Focus on both usability and security
